1.0 PROJECT SUMMARY

The decontamination and dismantlement (D&D) of above-grade Pilot Plant Complex components was performed successfully and in accordance with the project planning/design requirements specified in the Pilot Plant Complex Implementation Plan (DOE 2002). As required by the Implementation Plan, this document serves as the Pilot Plant Complex D&D Project Completion Report. Following completion of the last Operable Unit 3 (OU3) D&D Project, this project completion report will be compiled with reports from all OU3 D&D projects to prepare the Final Remedial Action Report for OU3.

The execution of the Pilot Plant Complex D&D project began on June 3, 2002 with the mobilization of the D&D Contractor. Project completion was achieved on July 20, 2004 and is defined by the signed Final Acceptance/Turnover document that transfers the area to Fluor Fernald Facilities Management. This document signifies "Completion of Field Activities" per Section 4.2.4 of the OU3 Integrated RD/RA Work Plan (DOE 1997).

The scope of the Pilot Plant Complex D&D Project included the following major activities:

- Hazardous Waste Management Unit (HWMU) Closure Tasks
- Asbestos abatement/removal;
- Surface decontamination;
- Above-grade component dismantlement;
- Environmental monitoring; and
- Material management.

Section 2 presents a component-specific remediation summary. HWMU closure tasks are covered in Section 3. Material management is discussed in Section 4. The results of environmental monitoring conducted in support of this project are presented in Section 5.

The following components were included in the scope for D&D of the Pilot Plant Complex:

- Building 13A - Pilot Plant Wet Side
- Building 13B - Pilot Plant Maintenance Building
- Building 13C - Sump Pump House
- Component 13D - Pilot Plant Thorium Tank Farm
- Building 37 - Pilot Plant Annex
- Building 54A - Six to Four Reduction Facility #1
- Building 54B - Pilot Plant Warehouse
- Building 54C - Pilot Plant Dissociator Shelter and
- Component 74U - Pilot Plant Pad (Existing Overhead Bridge Crane Structure)

1.1 Description of Complex

The buildings/components remediated under the scope of the Pilot Plant Complex D&D project included most of the structures located within the southeastern-most block of the former Production Area, which was situated south of 1st Street and west of the former Analytical Laboratory Building (Building 15A). The Pilot Plant Complex is illustrated in Figure 1-1.

Figure 1-1 Pilot Plant Complex

1.2 Project Chronology

Table 1-1 lists the chronology of above-grade D&D activities for the Pilot Plant Complex:

TABLE 1-1 D&D Chronology

ACTIVITY	START	FINISH
Notice To Proceed	3/13/02	
Mobilization/Demobilization	6/3/02	6/7/04
Dismantlement:		
• Building 13A – Pilot Plant Wet Side	8/8/02	4/29/04
• Building 13B – Pilot Plant Maintenance Building	6/5/02	11/8/02
• Building 13C – Sump Pump House	10/14/02	12/10/02
• Component 13D – Pilot Plant Thorium Tank Farm	11/25/02	8/15/03
• Building 37 – Pilot Plant Annex	8/7/02	1/29/03
• Building 54A – Six to Four Reduction Facility #1	8/1/02	4/26/04
• Building 54B – Pilot Plant Warehouse	6/11/02	7/30/02
• Building 54C – Pilot Plant Dissociator Shelter	9/30/02	11/11/02
• Component 74U – Pilot Plant Pad (Crane Structure)	7/22/02	4/29/04
Debris Size Reduction and Containerization:		
• Building 13A – Pilot Plant Wet Side		6/1/04
• Building 13B – Pilot Plant Maintenance Building		11/15/02
• Building 13C – Sump Pump House		4/18/03
• Component 13D – Pilot Plant Thorium Tank Farm		8/19/03
• Building 37 – Pilot Plant Annex		2/12/03
• Building 54A – Six to Four Reduction Facility #1		6/1/04
• Building 54B – Pilot Plant Warehouse		8/1/02
• Building 54C – Pilot Plant Dissociator Shelter		11/12/02
• Component 74U – Pilot Plant Pad (Crane Structure)		6/1/04
Turnover of the Pilot Plant area to the Soil and Disposal Project		6/7/04
Soil and Disposal Project removal of the Tc99 concrete slab from the Southern Extraction Area (formerly Building 13A)	6/29/04	7/17/04
“Completion of Field Activities” (CFA) per the OU3 Integrated RD/RA Work Plan		7/20/04

2.0 REMEDIATION APPROACH

2.1 Preparatory Actions

Safe Shutdown activities were performed by Fernald Closure Project (FCP) personnel under Removal Action No. 12 and were concluded for the Pilot Plant Complex on October 1, 1996. Safe Shutdown activities consisted of:

- removal of all salvageable equipment
- removal of loose, gross contamination

- removal of hold-up material
- general clean-up; and
- disconnection of all utilities

2.2 Component-Specific Remediation Summary

2.2.1 Building 13A – Pilot Plant Wet Side

Background

Building 13A, (Pilot Plant Wet Side), was a multi-level processing facility which measured approximately 63 feet x 155 feet x 35 feet high for approximately 80 percent of the structure. The structural height for the remaining 20 percent was 53 feet.

Numerous processing functions were developed in Building 13A during operation of the Pilot Plant. These processes included size reduction, dissolution, precipitation, filtration, solvent extraction and drying of several uranium, thorium and zinc compounds.

Remedial Tasks

An initial wash down of the building interior was performed prior to the start of dismantlement. Lockdown was applied to all the building and equipment surfaces. Materials containing ACM such as piping insulation, equipment insulation and interior wall insulation were abated. The acid brick was removed and containerized for offsite shipment. Interior equipment and the 13A structure were dismantled and size-reduced using a hydraulic shear. The CMU wall common to Building 13A and Building 54A was dismantled as part of Building 13A. The concrete slab (from Column Lines 1 to 4 and "A" to "E") containing an elevated concentration of technetium-99 was removed for offsite shipment. Materials generated during the dismantlement of Building 13A include ACM insulated piping, ACM equipment & interior wall insulation, conduit, equipment, structural & miscellaneous steel, doors & windows, acid brick, CMU block and concrete.

Photos

Photos 1 through 7 of Attachment 3 show the following activities for the D&D of Building 13A:

- 1 – Transite removal.
- 2 – Transite removal.
- 3 – Structural demolition.
- 4 – Structural demolition.
- 5 – Structural demolition.
- 6 – Structural demolition.
- 7 – Structural demolition.

2.2.2 Building 13B – Pilot Plant Maintenance Building

Background

Building 13B, (Pilot Plant Maintenance Building), was a single-level structure that measured approximately 30 feet by 60 feet by 11 feet in height. Building 13B consisted of CMU walls supported by a reinforced, poured concrete floor and built-up roof. The interior of Building 13B consisted of two tile-floored offices and a concrete floor storage area.

Equipment maintenance activities were performed in Building 13B during the Pilot Plant operation period. The building was later converted for use as a base of operation for radiological technicians involved in renovation, removal actions and remediation studies at the FEMP.

Remedial Tasks

Prior to the start of dismantlement, lockdown was applied to all the building and equipment surfaces. Materials containing ACM such as piping insulation and floor tile & mastic were abated. The Building 13B structure was dismantled and size-reduced using a hydraulic shear. Materials generated during the dismantlement of Building 13B include ACM piping, conduit, ACM floor tile & mastic, doors & windows, CMU block, roofing material and structural & miscellaneous steel.

Photos

Photos 8 and 9 of Attachment 3 show the following activities for the D&D of Building 13B:

- 8 – Structural demolition.
- 9 – Structural demolition.

2.2.3 Building 13C – Sump Pump House

Background

Building 13C, (Sump Pump House), was a single-level CMU structure with dimensions of 12 feet by 16 feet by 8 feet high located to the southwest of the Pilot Plant Wet Side (Building 13A). Building 13C housed pumps and associated equipment that extracted liquids from adjacent underground concrete sump tanks located adjacent to Building 13C on the east side.

Building 13C was used to pump filtered sump system flows from treatment facilities inside the Pilot Plant Wet Side to the General Sump for final treatment and discharge.

Remedial Tasks

An initial wash down of this building was performed prior to the start of dismantlement. Lockdown was applied to all the building and equipment surfaces. Materials containing ACM such as piping insulation were abated. The Building 13C structure was dismantled and size-reduced using a hydraulic shear. Materials generated during the dismantlement of Building 13C include equipment, ACM piping, conduit, roofing material, doors & windows, CMU block and structural & miscellaneous steel.

Photos

Photos 10 and 11 of Attachment 3 show the following activities for the D&D of Building 13C:

- 10 – Structural demolition.
- 11 – Structural demolition.

2.2.4 Component 13D – Pilot Plant Thorium Tank Farm

Background

Component 13D, (Pilot Plant Thorium Tank Farm), was an above-ground storage tank area located west of the Pilot Plant Wet Side (Building 13A). The tank farm consisted of five vertical, cylindrical, steel tanks situated within a 28 feet by 45 feet by 18 feet high concrete secondary containment structure.

Component 13D stored thorium nitrate tetrahydrate liquid, bulk process chemical and spent solvents from Building 13A processes. Overhead piping was used to transfer the liquids between the tanks and Building 13A.

Remedial Tasks

An initial wash down of the tank farm was performed prior to the start of dismantlement. Lockdown was applied to all the tanks and equipment surfaces. Materials containing ACM such as piping insulation were abated. Component 13D was dismantled and size-reduced using a hydraulic shear. Materials generated during the dismantlement of Component 13D include equipment, ACM insulated piping, conduit, and miscellaneous steel.

Photos

Photos 12 and 13 of Attachment 3 show the following activity for the D&D of Component 13D:

- 12 – Structural demolition.
- 13 – Structural demolition.

2.2.5 Building 37 – Pilot Plant Annex

Background

Building 37, (Pilot Plant Annex), was a rectangular, single-story building measuring approximately 52 feet by 122 feet and 25 feet high.

The function of Building 37 was to test new processes for uranium and thorium production and recovery. Building 37 contained six process areas and frequently changed configuration to meet the mission of testing processes for potential improvements of operations at other plants of the FEMP.

Remedial Tasks

An initial wash down of this component was performed prior to the start of dismantlement. Lockdown was applied to all the building and equipment surfaces. Materials containing ACM such as piping insulation were abated. Building 37 was

dismantled and size-reduced using a hydraulic shear. Materials generated during the dismantlement of Building 37 include equipment, ACM insulated piping, conduit, CMU block, roofing material, doors & windows and structural & miscellaneous steel.

Photos

Photos 14, 15, 16 and 17 of Attachment 3 show the following activities for the D&D of Building 37:

- 14 – Structural demolition.
- 15 – Structural demolition.
- 16 – Structural demolition.
- 17 – Structural demolition.

2.2.6 Building 54A – Six to Four Reduction Facility

Background

Building 54A, (Six to Four Reduction Facility), was an irregularly shaped structure located at the south end of 1st Street with maximum dimensions of 165 feet by 123 feet by 44 feet high.

The main processing area contained three, three-level steel structures that housed the hydrogen fluoride recovery system, the uranium hexafluoride to uranium tetrafluoride reactors and the acid vapor scrubber equipment. The primary process in Component 54A was the chemical reduction of uranium hexafluoride to uranium tetrafluoride.

The autoclaves were located in the south section of Building 54A. This area was constructed of steel frame with insulation and sheet metal skin. The autoclave test loads were the source of the 47 drums of lead.

Remedial Tasks

An initial wash down of external and accessible internal surfaces was performed prior to the start of dismantlement. Lockdown was applied to all the equipment surfaces. Materials containing ACM such as piping insulation, interior/exterior transite & batt insulation and floor tile & mastic were abated. Interior equipment and the Building 54A structure was dismantled and size-reduced using a hydraulic shear. Materials generated during the dismantlement of Building 54A include equipment, ACM insulated piping, conduit, batt insulation, transite, floor tile & mastic, CMU block, roofing material, doors and windows and structural & miscellaneous steel.

Photos

Photos 18, 19, 20 and 21 of Attachment 3 show the following activities for the D&D of Building 54A:

- 18 – Transite removal.
- 19 – Structural demolition.
- 20 – Structural demolition.
- 21 – Structural demolition.

2.2.7 Building 54B – Pilot Plant Shelter

Background

Building 54B (Pilot Plant Shelter), was a single story building located south of 1st Street in the northeastern corner of the Pilot Plant Complex. The shelter was a steel framed structure, rectangular in shape with dimensions of 50 feet by 74 feet by 10 feet high.

Building 54B originally provided temporary storage of uranium tetrafluoride, which was produced by the reduction process housed in the Six to Four Reduction Facility. Most recently, Building 54B was used for storage of inventory materials until their removal under a preparatory action.

Remedial Tasks

Prior to the start of dismantlement, lockdown was applied to all the building and equipment surfaces. A hydraulic shear was used to dismantle and size reduce the Building 54B structure. Materials generated during the dismantlement of Building 54B include piping, conduit, doors & windows, and structural & miscellaneous steel.

Photos

Photos 22, 23, 24 and 25 of Attachment 3 show the following activities for the D&D of Building 54B:

- 22 – Structural demolition.
- 23 – Structural demolition.
- 24 – Structural demolition.
- 25 – Structural demolition.

2.2.8 Building 54C – Pilot Plant Dissociator Shelter

Background

Building 54C, (Pilot Plant Dissociator Shelter), was a metal frame, single-story structure on a poured concrete floor, measuring 20 feet by 48 feet by 19 feet high.

Building 54C contained three ammonia dissociators that were used to catalytically dissociate anhydrous ammonia to hydrogen and nitrogen for use in the Pilot Plant Six to Four Reduction Facility.

Remedial Tasks

Since Building 54C was a radiologically clean facility, no lockdown was applied prior to dismantlement. A hydraulic shear was used to dismantle and size reduce the Building 54C structure. Materials generated during the dismantlement of Building 54C include equipment, piping, conduit and structural & miscellaneous steel.

Photos

Photos 26 and 27 of Attachment 3 show the following activities for the D&D of Component 54C:

- 26 – Structural demolition.

27 – Structural demolition.

2.2.9 Component 74U – Pilot Plant Pad

Background

Component 74U, (Pilot Plant Pad), is a reinforced concrete pad located immediately south of the Pilot Plant Six to Four Reduction Facility. Component 74U housed the overhead bridge crane that was the only above-grade portion of this component dismantled under the Pilot Plant Complex D&D Project.

Materials destined for use in the Six to Four Reduction Facility were unloaded with the overhead bridge crane.

Remedial Tasks

Since Component 74U was a radiologically clean facility, lockdown was not applied prior to the start of dismantlement. A hydraulic shear was used to dismantle and size reduce the Component 74U structure. Materials generated during the dismantlement of Component 74U include structural steel.

Photos

There were no photos available for the D&D of Component 74U:

3.0 HWMU CLOSURE TASKS

3.1 HWMU #54, Thorium Nitrate Tank (T-2)

Tank T-2 was classified as a HWMU (HWMU No. 54) based on storing waste thorium nitrate (characterized as D0002 – corrosive, D0006 – cadmium and D0007 – chromium) for greater than 90 days. As part of the Thorium Nitrate Stabilization Project (TNSP) conducted under Removal Action 9, the waste was removed from the tank and treated to meet LDR treatment standards. Decontamination was achieved by flushing the tank system with water. Samples of the decontamination rinseate were analyzed and met Ohio EPA closure guidance limits for pH, cadmium and lead. A sample of the storm water that had collected in the secondary containment area also met Ohio EPA closure guidance limits for these constituents. In November 1998, these results were transmitted to Ohio EPA and concurrence was obtained from the Agency for the completion of remedial activities for this unit. As a result, all field activities have been completed to achieve closure of HWMU #54. In accordance with the 1996 Integrated RCRA/CERCLA Director's Findings and Orders, final certification of closure of this unit will be addressed in the OU3 Final Remedial Action Report.

4.0 MATERIAL MANAGEMENT

Generated Debris

Debris generated from the D&D of the Pilot Plant Complex Components was size reduced, segregated, and containerized in accordance with the requirements identified by the Material Segregation and Containerization Criteria (MSCC).

Containerized materials that either have, or will be, disposed of in the FCP On Site Disposal Facility (OSDF) are presented in Table 4-1. This information is identified in the Integrated Information Management System (IIMS) report, shown as Attachment 1. IIMS reports generally represent activities associated with materials generated by the project that either have been or are destined for disposition in the OSDF. In addition to the containerized materials shown in Table 4-1, transite panels from the Pilot Plant Complex D&D Project were stockpiled as discussed below.

Soil, soil-like materials and associated debris not meeting OSDF waste acceptance criteria but does meet waste pits remedial action project (WPRAP) disposal requirements are presented in Table 4-2. This information is also identified in the Integrated Information Management System (IIMS) report, shown as Attachment 1. This material is currently located at Soil Pile 7 and will be processed through WPRAP and dispositioned at Envirocare.

Containerized materials requiring disposal at an off-site facility are presented in Table 4-3. This information is identified in the Site-wide Waste Information Forecasting and Tracking System (SWIFTS) database report, shown as Attachment 2. SWIFTS provides reports that track contaminated materials that will be disposed of at an off-site facility.

Stockpiling

The transite panels generated from Buildings 13A and 54A have been moved to the OSD-038 stockpile location. All other building pads associated with the Pilot Plant Complex D&D Project are clear of debris and any other waste materials.

Wastewater

The collection and disposition of wastewater is detailed in Section 5.1.

5.0 ENVIRONMENTAL MONITORING

Project-specific environmental monitoring for the Pilot Plant Complex D&D Project included wastewater monitoring and radiological air monitoring.

5.1 Wastewater Monitoring

Accumulation of Decontamination Water

There were two 18,000-gallon collection tanks and two 17,000-gallon tanks that were used for accumulating decontamination water. Samples taken from the tanks identified as thorium tanks were also analyzed for isotopic thorium.

Collection of Rinseate from Hydro-Cleaning

Gross wash down was accomplished by hydro-cleaning the contaminated surfaces in Buildings 13A, 13C, 13D, 37 and 54A. Rinseate water filtered down into the main sumps. Rinseate from the sumps was filtered to 5 microns and pumped into one of the four available collection tanks.

Sampling

The Pilot Plant Complex D&D project decontamination water (non-thorium) was sampled for Total U, percent U 235, pH, heavy metals and oil & grease. In addition to these parameters, thorium decontamination water was sampled for Th228, Th230 and Th232.

Transfer to AWWT Facility

There were a total of four discharges of decontamination water to the AWWT Facility. The four discharges were made to AWWT Phase 2 totaling 70,000 gallons of wastewater treated through the AWWT facility between June 2002 and July 2004.

5.2 Radiological Air Monitoring

Air Monitoring Data Recorded at FCP Boundary

The IEMP environmental radiological air emissions data from the monitoring period of June 2002 through July 2004 indicated sporadic, short-term increases in fence line airborne uranium concentrations. The increases, which may be attributable to emissions from the D&D of the Pilot Plant Complex, are within the historical range of concentrations measured during previous D&D projects. Airborne uranium concentrations at the FCP boundary are influenced by emissions from all site projects, work activities and wind erosion of contaminated soils and materials.

Historical fence line data collected during similar D&D projects (Plants 1, 4, 7, and 9) indicate uranium concentrations averaged less than one half of one percent of the DOE maximum off-site guideline of 0.1 pCi/m³. During the monitoring period of June 2002 through July 2004, the average uranium concentrations also indicated levels less than one half of one percent of the guideline. The maximum uranium concentration (at AMS-3) was 0.0023 pCi/m³, which represents less than three percent of the DOE maximum off-site guideline. The relationship between 0.1 pCi/m³ and mrem/year may be understood by the conversion factors used to equate the two terms; if inhaled continuously (24 hours/day, 365 days/year), 0.1 pCi/m³ of total uranium in air will result in a dose of 100 mrem/year.

5683

It should be noted that various assumptions have been incorporated in this conversion factor. The data from AMS-3 suggest that emissions from the Pilot Plant Complex D&D have not significantly affected compliance with DOE guidelines. Furthermore, the emissions from the Pilot Plant Complex D&D or the pipe bridge demolition project have not significantly affected compliance with NESHAP Subpart H limit of 10 mrem per year.

The locations of boundary (IEMP) fence line monitors are shown in Figure 5-1. The closest downwind monitors AMS-3, AMS-8A, and AMS-9C (which historically show the maximum downwind values for the site) indicated average uranium air concentrations during the D&D Projects of 0.00023, 0.00026, and 0.00028 pCi/m³ respectively. These concentrations represent less than 0.3 percent of the 0.1 pCi/m³ guideline and are within historical ranges of similar D&D projects.
